

## Pallet Deck Chair

DIY - Demonstrated by  
Mark Visser

### Chill out with this rustic pallet deck chair

Build your own deck chair  
made from a pallet - the  
perfect rustic addition to  
any outdoor living area

## 1 Introduction

Modernise your outdoor living area with this rustic pallet chair - a simple yet effective addition to any patio or alfresco area. Relax and enjoy summer in this trendy chair.

### Required power tools:

- > 18 volt lithium-ion cordless system
- > 18 volt lithium-ion cordless system
- > Planers
- > 18 volt lithium-ion cordless system
- > Mitre saws

### Other accessories:

### Detailed material list:

pcs	Designation	Length	Width	Thickness	Material
2	Large hardwood pallet				
12	Baton screws	100mm			
1	Packet of galvanized timber screws	50mm			

## 2 Break down the pallet

Remove any nails or foreign materials that may be of danger to you or your equipment.

## 3 Prepare your materials

Using the larger, solid pieces of pallet wood, you will need to cut the following -  
- 2 x pieces 605mm long with 77.5 degree parallel cut at each end (front and rear leg)

- 2 x pieces 620mm long with 70.5 degree parallel cuts at each end (rear legs)
- 2 pieces 505mm long with one end cut at 90 degree and opposite end cut on the acute 76 degree
- 2 x pieces 860mm long with both ends cut at 90 degrees (seat rails) choose one end to be the top and cut a 60mm mitre at the top at 45 degrees
- 9 x pieces of slat type material to cut at lengths of 650mm (seat boards)

#### **4 Plane your edges**

Plane, sand and pencil edge all edges of the chair.

#### **5 Clamp seat rail into position**

Pre-drill two holes with two galvanized baton screws at each end. Remove the clamps and raise place two slats under the assembly you just made. Now, take an armrest piece and place it on its edge so that 2cm overhangs the outside edge of the rear leg. This should leave 50mm overhang at the front leg. Pre-drill holes and screw in position.

#### **6 Armrest and backrest**

Place your backrest piece into position, at 700mm down from the top, make and line it up with the top of the seat rail. On the inside edge of the armrest piece, you need to notch out a 30mm piece at a depth of 20mm to accommodate the backrest.

#### **7 Mirror the process**

Once you have notched the armrest, place the pieces in position, clamp, pre-drill and countersink.

This completes one side of your chair, repeat the process to mirror the side you have made. Ensure you mirror the piece and don't make it identical as it has to be opposite.

Once both are finished, stand upright and clamp a seat slat into a temporary place

#### **8 Screw in the seat panels**

First, place your first seat slat on the seat rails and overhang by 2cm. Pre-drill and screw into place.

#### **9 Backrest**

For the backrest, place your first piece 2.5cm above the edge. Pre-drill and screw into place.

#### **10 Finishing touches**

Trim and mitre any sharp corners. Sand and pencil edge all of your pieces before assembly. Refer to images as your progress through the project.
